                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        resistant pyruvate carboxylase gene, in a Corynebacterium glutamicum, by replacing a genomic copy of the wild-type pyruvate carboxylase gene with a selectable marker gene through homologous recombination to form a first recombination strain, and replacing the selectable marker gene in the first recombination strain, with feedback resistant pyruvate carboxylase gene through homologous recombination to form a second recombinant strain, where the homologous recombination in the above steps, occurs between the host cell and the vector. The feedback resistant pyruvate carboxylase enzyme is resistant to feedback inhibition from aspartic feedback-resistant pyruvate acid. The present amino acid sequence represents the mutant feedback-resistant pyruvate carboxylase enzyme of the invention.

Note: The present sequence is not shown in the specification but is derived from the wild-type feedback-resistant pyruvate carboxylase enzyme (AAU98053) given in figure 2 of the specification.

                                                                                                                                                            from
                                                                                                                                                             group
                                                                                                                                                             В
```

streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus/GBS (Streptococcus/GAS), given in C (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to detect Streptococcus in a biological sample. (I) is used to detect acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity for treatecoccus proteins. Streptococcus proteins.

Sequence 166 AA;

CC proteins #1-31. The S. pyogenes virulence genes can be used to CC produce attenuated microorganisms comprising a mutation that disrupt CC the expression of the virulence protein. The virulence genes, proteins CC or an attenuated microorganism are useful for therapeutic or diagnostic CC purposes. DNA encoding the virulence proteins, the proteins themselves, CC an attenuated microorganism or a vacchine comprising the virulence CC protein are useful for the manufacture of a medicament for use in CC the treatment or prevention of a condition associated with infection CC by Streptococcal or Gram-positive bacteria, for veterinary treatment, CC and in a screening assay for the identification of an antimicrobial CC drug. Disorders which can be treated using S. pyogenes virulence cC polynucleotide and polypeptide sequences include non-invasive infections CC and invasive infections e.g. impetigo, pharyngitis, mecrotising CC fasciltis, bacteraemia, streptococcal toxic shock syndrome (STSS), pneumonia and rheumatic fever. The virulence proteins are also useful CC in the preparation of antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RESULT 2

The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Entercococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in prolliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell prolliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      essential prokaryotic cellular prolifera

                                                                                                                                                                                                                               1079
                                                                                                                                                                                                                                                                                                                                                                                                           Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klabsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this pattent did not form part
     M. vaccae antigen GV-29 3' sequence

M. vaccae proteins. The M. vaccae proteins may be employed to activate T cells and natural killer cells, to stimulate the production of cytokines, to enhance the expression of co-stimulatory molecules on dendritic cells and monocytes, and to enhance dendritic cell maturation and function. The proteins can be expressed by standard recombinant methodology. Pharmaceutical compositions comprising the proteins or nucleic acid sequences encoding the proteins can be used for the treatment, prevention, and detection of disorders including infectious diseases, immune disorders and cancer. In particular, the compounds and methods are used for treatment of diseases of the respiratory system, such as mycobacterial infections, asthma, allergies, tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mycobacterium vaccae protein; antigen; T cell activation; cytokine; dendritic cell maturation; infectious disease; immune disorder; canc respiratory system; mycobacterial infection; allergy; tuberculosis; leprosy; sarcoidosis; lung cancer; asthma; skin disorder; psoriasis; dermatitis; eczema; alopecia areata; skin cancer; basal carcinoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc genes, their use in the discovery of novel antibiotics, the essential cc genes themselves and the encoded proteins. The prokaryotes used are convenient to the protein that coil, Staphylococcus aureus, Salmonella typhi, Klebsiella cc pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The cc invention is also useful for the identification of potential new targets cf for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, cc and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery cc programmes. The antisense nucleic acid sequence is also useful to screen compounds in rational drug discovery compounds in prokaryotic cellular proliferation protein.

Cc Note: The sequence data for this patent did not form part cof the printed specification, but was obtained in electronic format directly from WIPO at the proposition in the present sequence is a stop introposition with the process of the printed specification, but was obtained in electronic content discovery format directly from WIPO at the proposition in the present sequence data for this patent did not form part compounds in electronic format directly from WIPO at the proposition in the present sequence data for this patent did not form part compounds in electronic format directly from WIPO at the proposition in the present did not form part compounds in electronic format directly from WIPO at the proposition in the present did not format directly from wiPO at the proposition in the present did not format directly from wiPO at the proposition in the present did not format directly from wiPO at the proposition in the present did not format directly from wiPO at the proposition in the present did not format directly from wiPO at the proposition in the proposition in the prese

                                                                                                                                                                                                                                                                                                                                                                                                                     to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The intisense nucleic acids can also be used
CFE v9 protein sequence

The present invention relates to nucleic acids (AAH90701-AAH90918)
CC encoding polypeptides (AAM01002-AAM0114), which are essential for the
CC viability of a bacterial cell wall. The acronym CFE stands for "CEG For
CC Expression", where CEG stands for "Conserved Essential Gene". The nucleic
carids are useful for detecting the presence of proteins essential for the
CC viability of a bacterial cell wall in samples such as cells, tissues,
CC biological fluids, blood, serum, nose, ear or throat swabs with ligands,
CC and for detecting corresponding target nucleic acid molecules with
CC complementary sequences. The nucleic acids are also useful for
CC determining whether a genomic nucleotide sequence of interest is
CC essential for viability of a bacterial cell or whether it resides within
CC an operon, by integrating an exogeneous nucleotide sequence comprising a
CC portion of an open reading frame of the genomic sequence of interest
CC (comprising 200-500 base pairs) into the genomic sequence of interest
CC which confers a selectable phenotype to the cell, and determining cell
CC viability with a selection agent such as vaccines and for treating bacterial
CC acids and proteins are also useful as vaccines and for treating bacterial
CC acids and proteins are also useful as vaccines and for treating bacterial
CC acids and proteins are also useful as vaccines and for treating bacterial
CC acids and protein acids and antisense therapy. The nucleic acids
antihotic resistant hacterial infections

C; Comment: Six or 12 chains of biotin carboxyl carrier protein (BCCP) are found conzyme A to BCCP and (2) from BCCP to pyruvate, forming oxalacetate.
C; Comment: See PIR:A48665 and PIR:S36808.
C; Superfamily: biotin carboxyl carrier protein; lipoyl/biotin-binding homology C; Keywords: biotin binding
C; Keywords: biotin binding
C; Keywords: biotin binding
C; Keywords: biotin binding homology <LPB>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  blotin carboxyl carrier protein [validated] - Propionibacterium freudenreichii subsp. sh R;Alternate names: methylmalonyl-CoA carboxyltransferase biotin carboxyl carrier protein C;Species: Propionibacterium freudenreichii subsp. shermanii C;Date: 31-Mar-1980 #sequence_revision 31-Mar-1980 #text_change 01-Feb-2002 C;Accession: A03401
